

# Series 1001, 1001A and 1001XL Level Controllers

## Proven Performance

Versatile designs with no-bleed,  
forced-balanced operation

Norriseal has been a leader in providing quality level measurement devices to the petroleum market for over five decades. In addition to oil and gas applications, Norriseal level products serve in marine, steel, and industrial markets.

This brochure describes the Series 1001, the 1001A, and the 1001XL Liquid Level Controllers. The Series 1001 and 1001A can be right-hand or left-hand mounted while the 1001XL is used where back-mounting is preferred.

## Series 1001

The economical Series 1001 Level Controller uses a non-weatherproof case/cover.

## Series 1001A

The Series 1001A Level Controller uses a weather-resistant sealed case and a manifold-style pilot assembly.

## Series 1001XL

The Series 1001XL Level Controller offers the features of a Series 1001A, but with a back-mount connection.

## Features

■ **No-bleed Pilots.** The pneumatic controller is equipped with one of three types of no-bleed pilots: a snap pilot, throttling pilot, or patented Envirosave™ pilot.

■ **Removable Door.** The controller door can only be removed after opening 90°. This feature prevents the door from vibrating loose while in the closed position. A lever latch keeps a positive engagement between the case and the door.

■ **Weather-resistant Sealed Case (1001A & 1001XL).** An O-ring gasket seals internals from outside weather and allows the harmful exhaust gases to be vented to a remote area by tubing the vent connection to an exhaust manifold (when equipped with piped exhaust option).

■ **Built-In Filter.** A built-in 40-micron stainless steel filter in the gas supply connection reduces required maintenance of the controller's pilot.

Performance

## Features (continued)

- **Interface Control.** A wide spring range makes the control of a liquid interface possible with a standard displacer.
- **Marine Service.** Stainless steel internals are available.
- **Field-Reversible Action.** This adjustment determines whether rising liquid level will increase or decrease pilot output.
- **Right- or Left-Hand Mount (1001 & 1001A).** The controller may be changed for right-hand or left-hand mount in the field without additional parts.
- **Electric Controller.** This option utilizes a standard electric switch; SPDT or DPDT.
- **Dual Seal Certification.** CSA certified Dual Seal to ANSI/ISA 12.27.01 standard meets CEC and NEC secondary seal requirement.
- **Split Displacer.** For liquid dump spans greater than the standard displacers can provide, a split displacer can give dump spans up to 70 feet in length.
- **NACE.** All controllers can be configured to meet NACE MR0175-2002 specifications.

## Design

### Snap Pilot

The pilot is comprised of two valves – one to admit pilot pressure, and one to exhaust pressure.

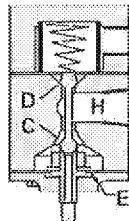

Ball "A" controls the flow of gas into the pilot and is held closed with force exerted by supply pressure on the seating area of the ball.

**Snap Pilot** When the force transmitted to thrust pin "B" is sufficient to overcome the force holding Ball "A" seated, "A" snaps upward allowing gas to flow past "A" and out the side port of the pilot.

The spherical end of thrust pin "B" closes the exhaust port the instant ball "A" snaps upward. The exhaust port seating area is smaller than the seating area of the supply port; therefore, the thrust pin will remain seated against supply pressure until force on the thrust pin diminishes.

A simultaneous action occurs as force is removed from thrust pin "B". Pilot pressure opens the exhaust port by unseating the thrust pin, and supply pressure forces ball "A" to close the supply port. The difference in seating area gives this pilot Snap-Action. The pilot then vents through the thrust pin entry hole.

### Throttling Pilot

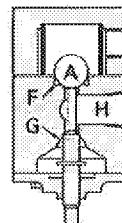

Two valves are used to admit and exhaust pressure. A diaphragm "E" used in cooperation with the valves creates a Force-Balance Pilot.

The pilot output pressure acts upon the diaphragm so that the diaphragm pushes back with the same force being applied by the push rod. These balanced forces are the reason for the term "Force-Balance."

The throttle pilot works in the same manner as the snap pilot except the output pressure is proportioned to the amount of force applied to the pin. More force on the pin produces a proportionate increase in pilot pressure.

When the pin force changes, the pilot seeks a new balance point by either exhausting the output loading at valve "C" or unseating valve "D" to increase output loading. Instrument gas does not flow while the pilot is in balance.

### Envirosave™ Pilot

This patented pilot works identically to the snap pilot. The difference between the two is the O-ring seals "F" and "G," which give a positive seal to eliminate leakage and prevent fugitive emissions. The EPA has independently measured the Envirosave™ pilot to have a zero CFH leak rate.\*

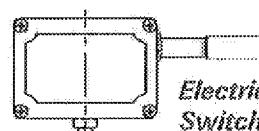

### Envirosave™ Pilot

### Electric Level Switch

The electric level switch uses the force balance principle to open and close an electrical switch in response to rising or falling levels. Two standard switches are available, single pole

double throw (SPDT) or double pole double throw (DPDT), both with explosion-proof enclosure. Controllers can be supplied "Dual Seal" certified to ANSI/ISA 12.27.01 standard meeting NEC & CEC secondary seal requirement.

# Principle of Operation

## Force Balance Principle

### Theory of Operation

The operation of the Series 1001, 1001A, and 1001XL Level Controllers is based on the Force Balance Principle. The **Force Balance Principle** states when an object is submerged in a liquid, it creates a buoyant force that is proportional to the weight of the liquid displaced. A Norriseal level controller uses a spring to balance the weight of a displacement-type element (displacer), eliminating the need for custom-weighted displacers and floats. As the displacer is immersed into the liquid, the amount of force available is proportional to the weight of the liquid displaced. The result of this force is transmitted to the controller by a rotational movement of the shaft. This rotational movement causes the fulcrum and lever (flapper bar) to push up the pilot thrust pin. The amount of force is proportional to the level on the displacer, creating a desired output signal. This desired output signal can be a pneumatic on/off signal using a snap pilot, a pneumatic modulating signal using a throttle pilot, or an electrical SPDT or DPDT signal by using an electric micro switch.

### Controller Action

Controller action is "Direct Acting" when the output signal increases as the liquid level rises on the displacer. In "Reverse Acting," the output signal decreases as the liquid level increases on the displacer.

### Proportional Band

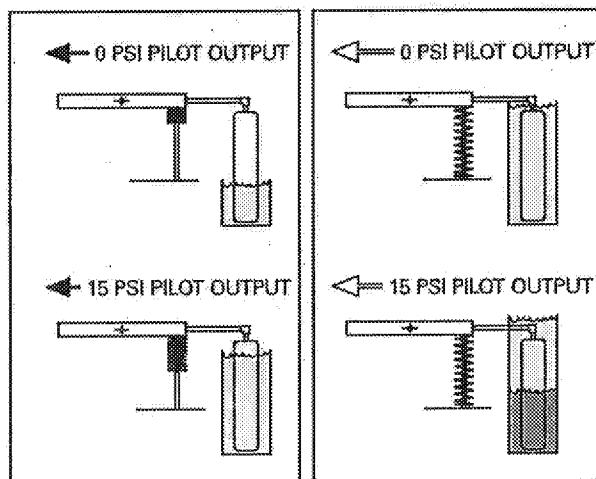

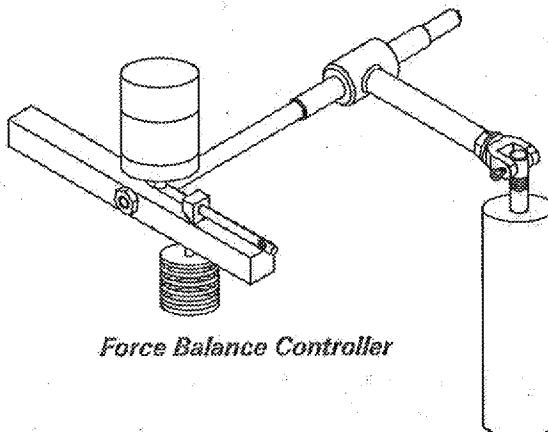

Proportional Band or Span is the ratio of the displacer length used versus the total length of the displacer to achieve a desired output signal. For on/off control, the snap pilot output is equal to the supply pressure over the span of the controller. The span can be changed by sliding the fulcrum on the lever. Moving the fulcrum away from the pilot thrust pin increases the span, and moving the fulcrum towards the pilot decreases the span. For throttling control, the output will vary over the proportional band.

### Function of the Adjustable Spring

Not only does the spring balance the weight of the displacer, it can also be adjusted to shift the setpoint on the displacer. With spring force held constant, a higher liquid level on the displacer produces a larger force available to the pilot. When the spring force is reduced by decompressing the spring, a higher liquid level on the displacer is required to produce the same force as before. Increasing the spring force by compressing the spring requires a lower liquid level for the same

force. Thus, increasing/decreasing the spring force will change the setpoint accordingly.

The spring compression can be reduced further to a position where a hydrocarbon liquid level will not produce enough force to produce an output from the pilot. This makes the control of a **liquid interface** possible with the standard displacer. After the spring is adjusted so the lighter liquid will not operate the control, there is still adequate spring force in reserve for the liquid level of heavier liquid to provide enough force to actuate the pilot.

Top-level control

Liquid interface control

# How to Order

**Determine the model number.** This specifies series and connection size; pilot type; left, right or back mount; pilot action; seals; and service condition.

**Required Application Information:**

- A. Fluid media
- B. Process temperature (maximum and minimum)
- C. Process pressure
- D. Vessel size and diameter (distance of connection from bottom of vessel, any obstructions that may hinder performance)
- E. Body connection type, size, and rating
- F. Displacer position (vertical or horizontal)
- G. Controller mount (right or left) if applicable
- H. Pilot action
- I. Area electrical classification if applicable
- J. Top level or interface

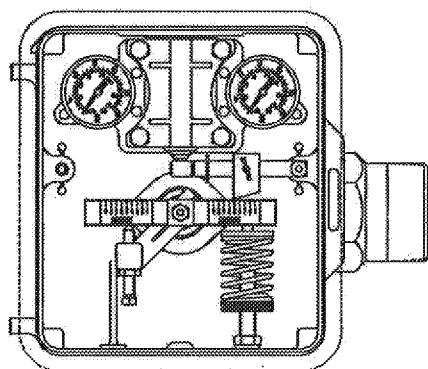

**Electric Level Switch**

The electric level switch uses the force balance principle to apply force to a standard Micro-switch.

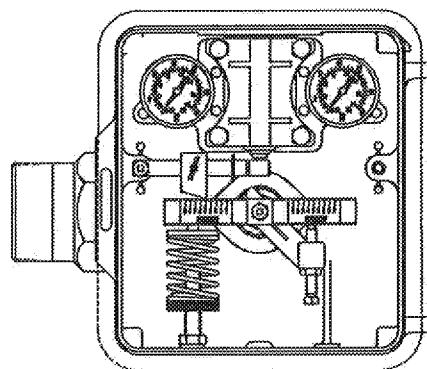

Two standard switches are available, both with explosion-proof enclosures: single pole double throw (SPDT) or double pole double throw (DPDT). Rating for SPDT switch is 15 amps at 125, 250, or 480 volts A.C. The DPDT switch rating is 10 amps at 125 or 250 volts A.C.

**Right-Hand Mount vs. Left-Hand Mount**

The Series 1001 and Series 1001A can be configured as right-hand mount or left-hand mount. The orientation of the displacer to the controller (while facing the front side of the controller) designates the mounting style. The mounting can be adjusted in the field. The Series 1001XL back-mount controller is utilized when neither right-hand or left-hand mounts are practical.

*Right-Hand Mount*

*Left-Hand Mount*

## STUD/GASKET (MATERIAL)

Code	Stud/Nut	Gasket	
		RF or FF	RJ
-	ASTM A193-B7/ASTM A194-2H	316L/GRF CSTL GR	CSTL Solid
A	ASTM A193-B8M/ASTM A194-8M	316L/GRF CSTL GR	316 SS Solid
B	ASTM A193-B7/ASTM A194-2H	316L/GRF 316SS GR	316 SS Solid
C	ASTM A193-B7/ASTM A194-2H	INC/GRF CSTL GR	-
D	ASTM A193-B8M/ASTM A194-8SBM	316L/GRF 316SS GR	316 SS Solid
L	ASTM A193-B7M/ASTM A194-2HM	INC/GRF 316SS GR	316 SS Solid
M	ASTM B164/Monel 400	MON/GRF 316SS GR	-

## RATING PROCESS CONNECTION

Code	Description
02	150
07	300
14	600
21	900
36	1500
14	NPT (WP)
	1480

### NOTE:

1. Flanged-LLC & dome/chamber connection rated same as process connection (except ANSI 150 Class). Dome/chamber connection is ANSI 300.
2. Threaded-dome/chamber connection is ANSI 600 class; higher pressure classes available.

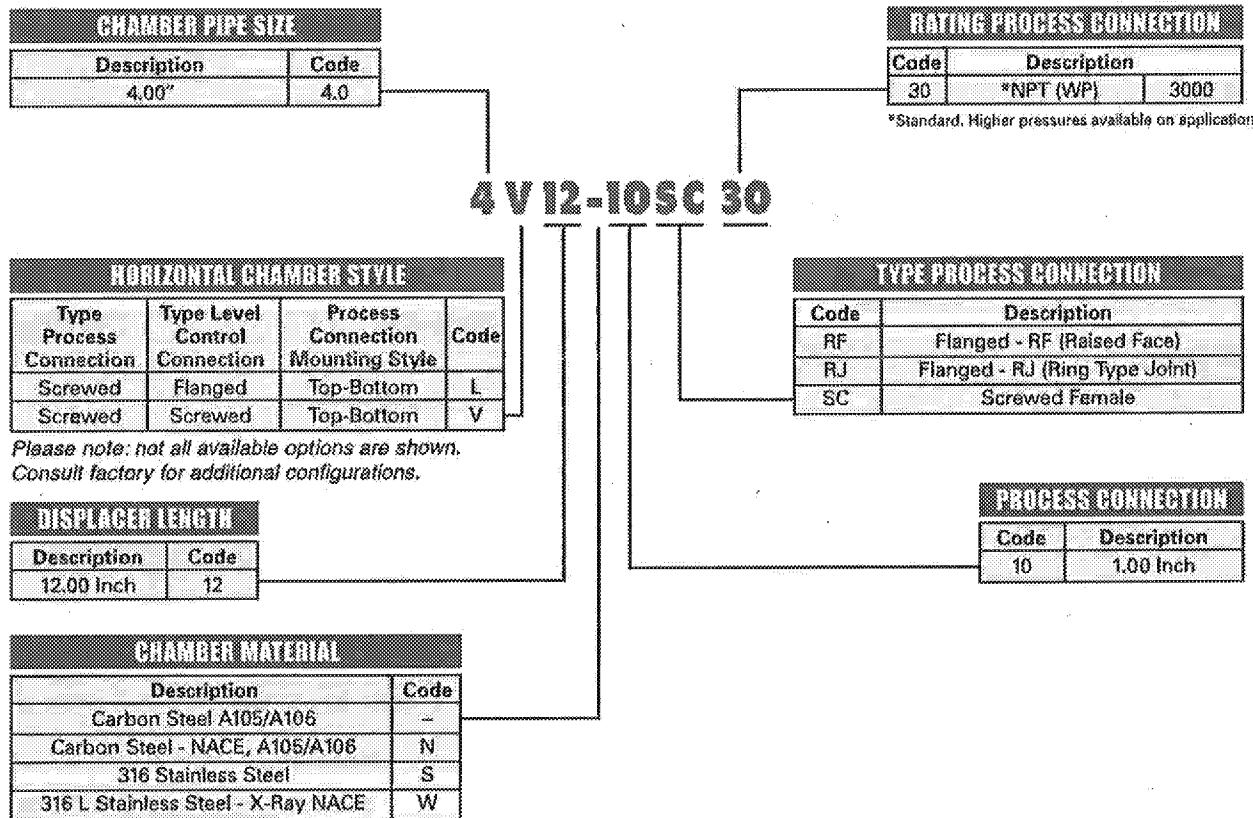

## TYPE PROCESS CONNECTION

Code	Description
RF	Flanged - RF (Raised Face)
RJ	Flanged - RJ (Ring Type Joint)
SC	Screwed Female
SM	Screwed Male

### NOTE:

Specify when gauge glass connections are required. Give size, position, and center-to-center dimensions.

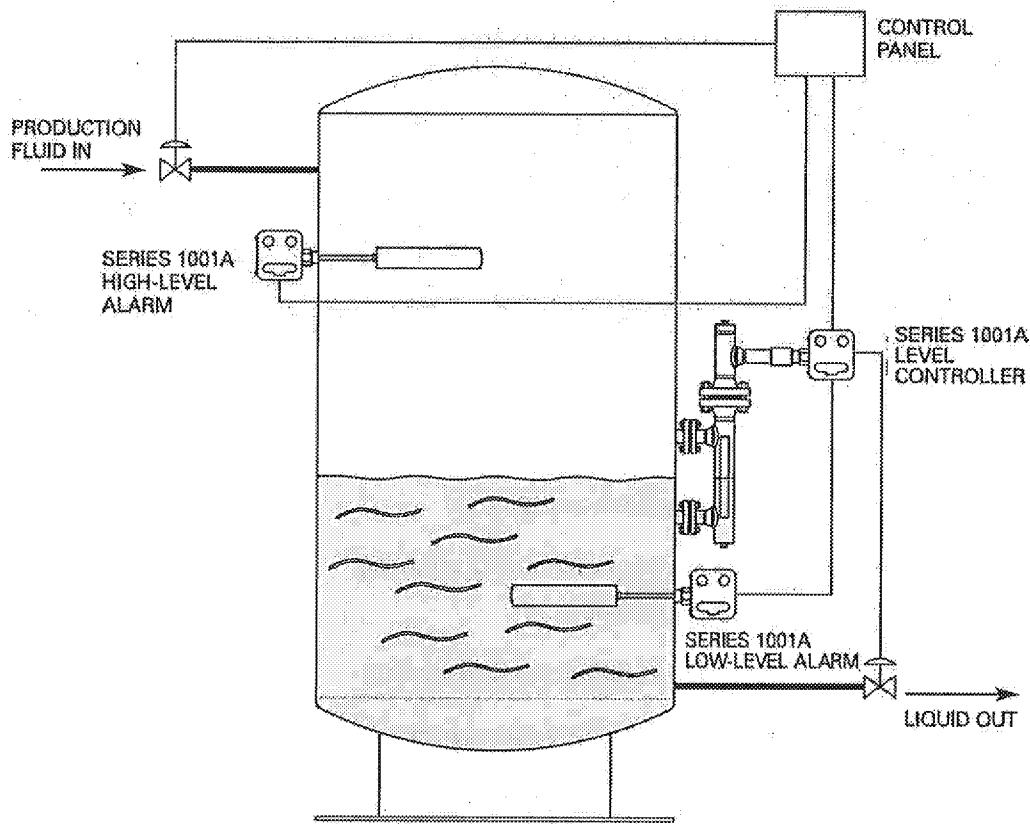

# Model Code: Horizontal Chambers

## NOTES:

- Controller-to-chamber connection is always 2 in.
- Additional materials (not shown above) are available for extreme service conditions.

# Applications

## Common Applications

1. Custody Transfer Measurement Systems
2. Separators
3. Dehydrators
4. Heater Treaters
5. Well Test Systems
6. Interface Detection
7. Compressor Scrubbers
8. Offshore Production Facilities

## *Why you can depend on genuine Norriseal products*

- In-house engineering and technical support
- In-depth applications experience
- Award-winning innovation and ongoing product development
- ISO 9001:2008 certified manufacturing
- Over five decades of industry service
- Compliance with all industry standards and specifications
- Responsive service and prompt delivery
- Field support available worldwide

*Please contact your Norriseal representative for more details and assistance in specifying the optimal solution for your application.*
